cell multiply hard
param A_WIDTH int 36
param B_WIDTH int 36
in a A_WIDTH
in b B_WIDTH
out out A_WIDTH + B_WIDTH
fn out = a * b
end
read_techlib
(located errors)
local cell type (hard / gate / blackbox)
ports: width rule = constant, param, function or compiled expression
params + defaults
attrs: area, delay
lib data: fn / seq / memory ASTs
BLIF reader (IR-7b)
.model ... .blackbox matched by port name; params inferred
simulator
fn hooks interpret the expressions
Phase 4: matcher
patterns = fn compiled to IR fragments
